

The Next-Gen IdP for *Humans* and *AI Agents*.

One converged identity core that keeps every identity visible, secured, and governed - from access to audit.

THE PROBLEM

Identity was never solved for humans.
AI agents just raised the stakes.

The workforce is now blended

Humans and AI agents act across the business together. Agentic identities already outnumber people by roughly 100x.

Identity runs at machine speed

Sub-agents and ephemeral workloads generate continuous auth requests, far faster than any human-paced review.

Identity is the new attack surface

Credentials, authenticators, sessions, and signing authority have all become attack paths.

Visibility stops at the IdP

Shadow accounts, orphaned credentials, and unregistered agents sit outside the identity system entirely.

Another layer will not fix a problem in the foundation.

Identity has to be rebuilt security-first, from the core.

See every identity. Secure every access path. Govern every action.

IDENTITY DISCOVERY

Unify the identity estate

One live graph of humans, AI agents, accounts, and access paths across directories, IdPs, cloud, and apps.

IDENTITY SECURITY

Protect the trust layer

Signing authority is split between NewCore and your environment; credentials are phishing-resistant.

AGENTIC GOVERNANCE

Govern identity in action

One policy grammar, one enforcement layer, one audit trail across humans and agents.

Under the hood: *the mechanics* that remove the risk.

Secure Split Key (SSK)

TWO HALVES, ONE VERIFIED SIGNATURE

Every legacy IdP holds the root master key - breach the vendor, breach every customer. SSK splits signing authority: NewCore holds one half, the other lives inside your perimeter. Neither half alone can forge a token. **IdP supply-chain risk drops to zero**, post-quantum ready by default.

Visual MFA

RETIRING PHISHABLE FACTORS

A push factor that cannot be dictated over the phone. One tap, no codes to read out - resistant to relay, replay, and social engineering, and built to reduce MFA fatigue.

Closes: AiTM phishing, push fatigue, helpdesk social engineering.

Agent Guardian

AGENT LIFECYCLE CONTROL

01	02	03
Issue	Govern	Revoke
Scoped, short-lived credentials tied to a human owner.	Every action attributed, approval required for high-risk moves.	One-click kill switch - every session and SaaS grant ends instantly.

Closes: standing secrets, over-scoped agents, unattributed action.

About NewCore. The next-gen IdP for humans and AI agents, authenticating, authorizing, and governing every identity. Founded by cybersecurity veterans and Unit 8200 alumni; backed by Cyberstarts, Index Ventures, and Evolution Equity Partners.

Secure every **human**.
Govern every **agent**.
